# Restaurant Management System in Python

# Introduction

A restaurant management system is a software solution designed to help restaurant owners and staff manage various aspects of the business. It simplifies tasks like:

- **Managing orders**
- **Handling the menu**
- **Processing payments and generating bills**
- **Tracking inventory**

# Key Features

The restaurant management system typically includes the following features:

1. **Order Management:** Ability to take new orders, update ongoing orders, or cancel orders.
2. **Menu Management:** Adding, updating, or deleting menu items based on availability.
3. **Billing System:** Automatically generates bills for customers and applies taxes and discounts.
4. **Inventory Management:** Tracking available stock in the kitchen and updating when supplies are used.
5. **Table Booking:** Allow customers to book tables in advance, view available tables, and manage reservations.

# Core Functionalities

Some of the primary features of the restaurant management system include:

## User Authentication:

Different access levels for admins and waitstaff.

## Menu Handling

Admins can manage menu items by adding, updating, or deleting them

## Order Processing:

Admins can manage menu items by adding, updating, or deleting them

## Generating Bills:

The system calculates the total, applies taxes, discounts, and generates the final bill.

## Table Booking:

Customers can reserve tables in advance, and staff can manage the booking status.
